## SYSTEM ARCHITECTURE

## WHAT MAKES IT DIFFERENT

- **LLM thinks nightly; code trades intraday.** Inference goes to research and reflection — execution is deterministic, auditable, outage-proof.
- **It genuinely improves itself.** Night 1 it found a stop→re-entry flaw in all 5 of its own strategies, unprompted; mid-week it wrote salvage rules that recovered ~\$1,165 of decaying premium; its last report critiques its own stops.
- **Autonomy is earned, bounded, and revocable.** Per-strategy tiers; revisions pass byte-exact staleness + version checks; a freeze bars the agent from ever raising its own authorization.
- **Everything is explainable.** Strategies are readable YAML; every decision has a journal row; every nightly report ships a full tool-call transcript.

## THE LIVE RUN — HONEST SCOREBOARD

- Fresh **\$100k** paper account · one kickoff chat · then **5 days hands-off** (0 human trading decisions)
- **17 rule-driven fills** — 4 stock legs + 5 option legs in, every exit by stop / salvage / expiry sweep
- **12 nightly self-revisions** auto-applied through the guarded pipeline
- **-4.9%** (\$95,138): stock book ≈ flat (-\$180); the 5-DTE options overlay paid -\$4.7k tuition — **diagnosed in writing by the agent itself on night one**, then corrected all week

Judges' shortcut: the **Reports page** replays every nightly reflection with its full tool-call transcript — the audit trail is the demo.

## FULL FRAMEWORK — HOW THE PIECES CONNECT
